FINAL PROJECT v2026.10.15

KEY MESSAGE

The Medium-congestion welfare gap falls from 0.946 to 0.050 in the benchmark CCAR example, but the rule also has no-effect and adverse parameter regions.

01 Question and foundations

Research question & verified gap

When do private confidentiality costs and public congestion make voluntary M/P/F disclosure inefficient, and when does CCAR improve welfare?
Closest work: Los et al. (2020); Liu & Chow (2022); Maheshwari et al. (2025).
Contribution: a reproducible stylized comparison with failure regions, not a theorem or aviation field result.

Strategic model and Intellectual Merits

PRIVATE TYPE Low or High confidentiality cost

ACTION Minimum / Partial / Full

BNE Best response to rival's type strategy

CCAR Minimum access factor αM at Medium/High

Three complementary lenses

Game theory predicts complete type-contingent pure BNE.
Social choice compares operator utility with total welfare and an infeasible type-observing reference.
Mechanism design tests a congestion-contingent rule for enhanced, non-safety access.

Auction or allocation comparison

One residual commercial priority slot. FCFS: first eligible request, zero payment.
Second-price auction: highest bid wins, pays second bid.
Seed-206 simulation: mean efficiency 0.622 vs 1.000. Emergency and public-safety missions remain outside payment-based access.

02 Model and verified evidence

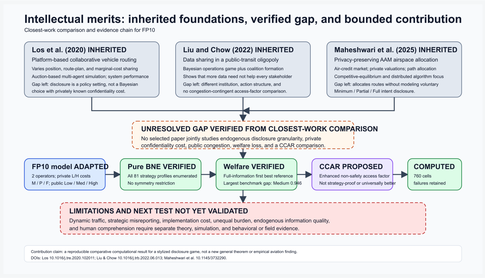

Figure 1. Three closest foundations feed an endogenous-disclosure Bayesian model, welfare benchmark, CCAR test, and explicit limitations.

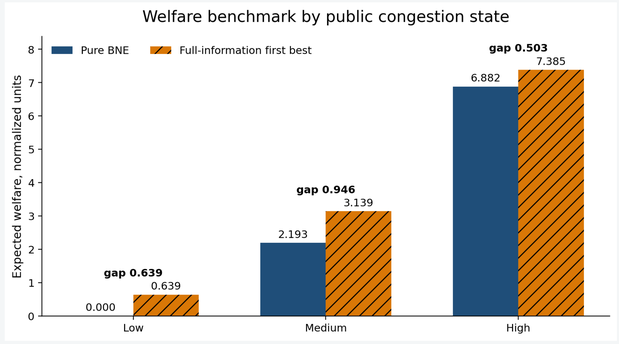

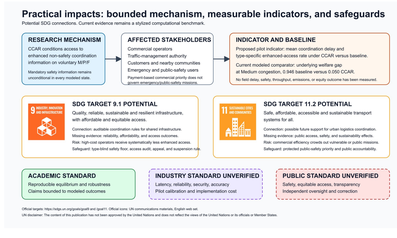

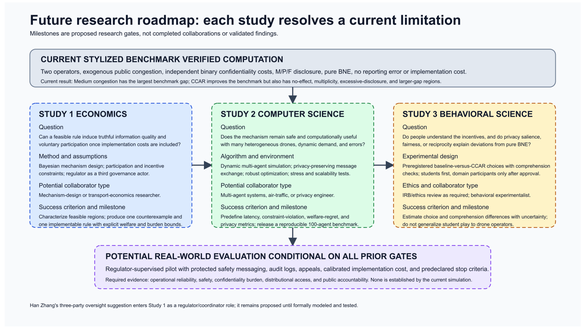

Figure 2. Expected normalized welfare. Low: 0.000 / 0.639. Medium: 2.193 / 3.089 / 3.139. High: 6.882 / 6.882 / 7.385 (BNE / CCAR / first best).
760 deterministic grid cells: 401 no-effect; 334 robust improvements; 18 excessive-disclosure flags; 3 larger-gap; 66 multiple CCAR BNE. Diagnostics overlap.
Verification: outputs/final/; exhaustive 81-profile search. Evidence: stylized computation.

03 Practical impacts and roadmap

Practical Impacts diagram with SDG targets

Future Research Roadmap new diagram

Integration and updated named contributions

Economics defines incentives and welfare; computation exposes failure regions; those failures narrow the practical claim and motivate comprehension/fairness tests.
Yiqiao Liu: model boundary, code, experiments, interface, paper and poster; 65 baseline tests and fresh artifact verification.
Limits: two operators/types, exogenous congestion, pure strategies, no calibration, report-quality or implementation-cost model.

OCT 12 / OCT 14 historical activity records: author confirmation pending
OCT 21 Final submission at 23:00 Shanghai

Full acknowledgments

Prof. Luyao Zhang: course design and official templates. Prof. Kenneth S. (Ken) Rogerson: documented course-workshop context; no direct FP10 review claimed. Han Zhang: proposed three-party oversight extension. Xinrong Sun: novelty, domain, congestion-benefit and CCAR-externality challenges (author-supplied summaries; source records pending). Tencent Shanghai office; Shanghai Science and Technology Museum; COMSCI/ECON 206 classroom community. UN SDG assets; Python/NumPy/Matplotlib/nbclient/Gradio/Playwright/ACM template; OpenAI Codex assistance. Yiqiao Liu remains responsible.
